Note to Procurement Lead

Ceramic Tile Shade Matching — What We Are Proposing

To: Head of IT & OT Procurement / Special Projects Lead, Procurement | **From:** Forward Deployed Engineer, Banao Technology
Date: October 2026 | **Re:** Colour Correction System — Proposal Summary

The Problem in One Sentence

Manual shade matching during re-runs takes 6–7 hours and wastes thousands of square metres of tiles. Our system automates calculation in under 3 minutes, eliminating wasted tiles completely.

What We Are Proposing

A lab workstation and software system installed in your tile lab that:

1. **Scans sample tiles** using a calibrated camera in a standard lighting booth.
2. **Compares automatically** against your locked original master tile reference.
3. **Provides exact ink channel adjustments** to QC Technicians in under 3 minutes.

Requires QC review/approval before changes reach the printer (no automatic overrides).

The Workflow Change (Simple)

- **Today:** Print sample → fire → visual comparison → Photoshop guesswork → repeat for 6–7 hours (generating material waste).
- **With our system:** Fire sample tile 90 min before batch → scan (<3 min) → system generates exact corrections → QC approves → zero waste on production line.

What This Costs and What You Get Back

Category / Metric	Details / Value
Phase 1 Pilot (12 weeks, UAE plant, 1 line)	**$40,000 fixed price**
Hardware (camera + lighting booth)	Included (~$5,000 of the total)
Software + engineering	Included
On-site installation visits	Included (2 visits to UAE)

Category / Metric	Details / Value
Annual waste saved per line	**~$1.7 million** (at 7,500 m² × $1.50/m² margin loss × ~200 changeover events/year)
Payback on the pilot	**Less than 3 changeover events**

Payment terms: 50% on signing, 50% when the system meets the agreed target on your production line.

What We Need From You

1. **Site visit:** 2-day installation & calibration at UAE plant (lab space + power required).
2. **Physical master tiles:** Original approved tiles for pilot SKUs (10 SKUs recommended).
3. **QC team access:** 2–3 design sessions with QC Technicians.
4. **Printer slot:** 2–3 hours dedicated printer access for initial calibration print.

When Will You See Results?

Milestone	Timeline
Contract signed, kickoff	Week 1
Equipment installed and calibrated	Week 3
System running in advisory mode (QC sees suggestions)	Week 6
Full production mode with acceptance measurement	Week 10–12
Phase 1 report and go/no-go for India & Bangladesh	Week 12

One Important Honest Note

The system eliminates calculation delays and tile waste, but physical kiln firing time (45–90 min) remains unchanged by physics. Running a test tile 90 minutes prior to batch start ensures zero line stoppage.

We are ready to start upon approval. Contact us to arrange a brief follow-up call with your QC and plant operations teams to finalize Phase 1 scope.
